

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Previously Presented) An interface for communicating between a controller and a network client having a conventional web browser, the controller includes at least one input/output module utilized to control a device, the interface comprising:
  - an archive for compiling an application to be executed by the controller, the application being written in code supported by the web browser;
  - the interface responsive to the application for establishing a connection between the controller and the network client; and,
  - a plurality of JAVA beans responsive to the application for supporting communication between the controller and the network client upon establishing a connection therebetween, wherein the controller, the application, and the at least one input/output module cooperate to control the device.
2. (Previously Presented) The interface of Claim 1, further comprising a client handler operably attached to the network client and the controller for maintaining the connection between the controller and the network client.
3. (Previously Presented) The interface of Claim 2, further comprising a value adaptor operably attached to the network client for dispatching unsolicited data messages to the network client.
4. (Original) The interface of Claim 3, further comprising a server handler operably attached to the value adaptor for providing unsolicited data updates to the value adaptor.
5. (Original) The interface of Claim 3, further comprising a subscription list operably attached to the client handler for polling of the logic controller for data items requested by the network client.
6. (Original) The interface of Claim 5, further comprising an update queue operably attached to the subscription list for providing a buffering of the data updates.
7. (Previously Presented) An interface for communicating between a controller and a network client having a conventional web browser, the controller includes at least one input/output module utilized to control a device, the interface comprising:

an archive for compiling an application to be executed by the controller, the application being written in conventional code supported by the web browser;

the interface responsive to the application for establishing a connection between the controller and the network client; and,

a library responsive to the application for supporting data requests between the controller and the network client upon establishing a connection therebetween, the library including a client handler operably attached to the network client and the controller for maintaining the connection between the controller and the network client.

8. (Previously Presented) The interface of Claim 7, further comprising a value adaptor operably attached to the network client for dispatching unsolicited data messages to the network client.

9. (Original) The interface of Claim 8, further comprising a server handler operably attached to the value adaptor for providing unsolicited data updates to the value adaptor.

10. (Original) The interface of Claim 8, further comprising a subscription list operably attached to the client handler for polling of the logic controller for data items requested by the network client.

11. (Original) The interface of Claim 10, further comprising an update queue operably attached to the subscription list for providing a buffering of the data updates.

12. (Currently Amended) An interface for communicating between a controller and a network client having a conventional web browser, the controller includes at least one input/output module utilized to control a device, the interface comprising:

an archive for compiling an application to be executed by the controller, the application being written in conventional code supported by the web browser;

the interface responsive to the application for establishing a connection between the controller and the network client; and,

a library responsive to the application for supporting data requests between the controller and the network client upon establishing a connection therebetween, the library including a client handler operably attached to the network client and the controller for maintaining the connection between the controller and the network client and a value adaptor operably attached to the network client for dispatching unsolicited data messages to the network client.

13. (Original) The interface of Claim 12, further comprising a server handler operably attached to the value adaptor for providing unsolicited data updates to the value adaptor.

14. (Original) The interface of Claim 12, further comprising a subscription list operably attached to the client handler for polling of the logic controller for data items requested by the network client.

15. (Original) The interface of Claim 14, further comprising an update queue operably attached to the subscription list for providing a buffering of the data updates.

16. (Previously Presented) An application interface for communicating between a controller and a network client having a conventional web browser, the controller includes at least one input/output module utilized to control a device, the application interface comprising:

an archive for storing a class file utilized to compile an application, the application being supported by the web browser and executed by the controller; and,

a library responsive to the application for supporting communication between the controller and the network client upon establishing a connection therebetween, wherein the controller, the application, and the at least one input/output module cooperate to control the device.

17. (Previously Presented) The application interface of Claim 16 wherein the library facilitates the creation of a web page interactive with the application.

18. (Previously Presented) A method for facilitating communication between a controller and a network client having a web browser, the controller includes at least one input/output module utilized to control a device, the method comprising the steps of:

providing an archive containing a plurality of classes for writing an application, the application being written in code supported by the web browser and executable by the controller;

providing a library being responsive to the application for supporting communication between the controller and the network client upon establishing a connection therebetween; and,

creating a web page by utilizing the application, the web page being interactive with the application.

19. (Previously Presented) The method of Claim 18 further comprising loading the web page on the controller, wherein the web page can be monitored by the network client.

Response to Office Action Mailed August 26, 2005

Attorney Docket No. SAA-19-1 (402 P 318)

Application No. 10/601,143

Page 5

20. (Previously Presented) The method of Claim 18 further comprising loading the web page on a server, the server being operably connected to the controller, wherein the web page can be monitored by the network client.
